

Clarke has earned the Carpet and Rug Institute (CRI) bronze Seal of Approval for its BEXT 300 Extractor.

Exceeding average standards for carpet cleaning effectiveness.

Extractors that exceed average soil removal standards receive a bronze rating. The first phase of the Seal of Approval program for cleaning equipment tests “restorative” extractors designed for deep cleaning to remove as much of the soil from the carpet as possible.

To qualify for the Seal of Approval, extractors must undergo a stringent testing process at an independent laboratory that measures three key performance criteria:

- Amount of soil removed
- Amount of water left in the carpet sample
- Impact of the equipment on carpet fibers and appearance

BEXT extractors provide lightweight and portable carpet extraction with the added benefit of heated solution to improve cleaning effectiveness by as much as 40%! The Bext extractor was effective at recovering water from the carpet test sample and cleaning without damage to carpet fibers.

The Carpet and Rug Institute has shown that some equipment can cause excessive wear on the carpet. Effective carpet cleaning helps preserve the life and beauty of a carpet. These criteria are included because water and dirt left in a carpet negatively affect the appearance of the carpet, damage the fibers and create the potential for mold growth.

By passing CRI’s Seal of Approval, the BEXT extractors are proven Green by saving both money and the environment by reducing premature carpet replacement as well as reducing potential for mold growth.
